TECHNOLOGY NEWS

Human-robot

In human-robot collaboration, the robot assists the human operator. This means: The machine does not replace the human, but complements his capabilities and relieves him of arduous tasks. These can include overhead work, for example, or the lifting of heavy loads. Autonomous, collaborative robots are also used to supply production workstations

FUTURE OF WORK

While much of the discourse around AI and automation has been concerned with the looming threat to the workforce...

We need to know what the resources of the moon are. We have great evidence now because of different kinds of radar and spectroscopic analysis that people have been able to do. But we really do need to go visit there, and we can do that with a robot craft without any problem.

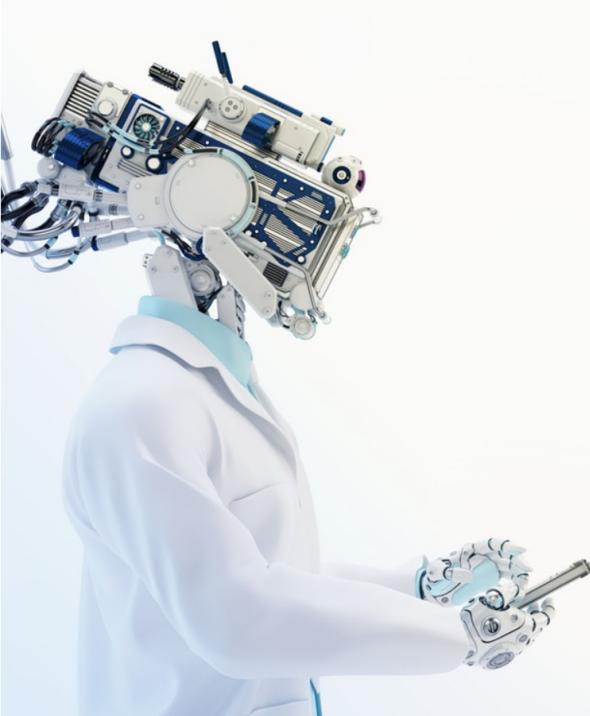

- Jeff Bezos -

Artificial Intelligence Robots And The Future Of Work

The number of robots in the world today is approaching 1,000,000, with almost half that number in Japan and just 15% in the US. A couple of decades ago, 90% of robots were used in car manufacturing, typically on assembly lines doing a variety of repetitive tasks. Today only 50% are in automobile plants, with the other half spread out among other factories, and many other industries.

AI PERSPECTIVES

Robots and AI

How many want to subject themselves to black lung disease and a host of other health problems from that job? This is why coal mining towns are dying out. Young people in these towns are moving on to the brighter job prospects. And technology is taking over what's left of the mining industry. Green energy is taking over, and with it, a host of new, clean jobs and careers. It's the march of civilization that will never cease.
